MAINTENANCE

IT IS REALLY NECESSARY TO CARRY OUT A PREVENTIVE MAINTENANCE ON YOUR EQUIPMENT AND INSTALLATIONS. IT ALLOWS TO:

- To extend their service life
- To optimise and coordinate the maintenance and production schedules
- To increase productivity
- To ensure their working way, environment, staff and materials safety
- To ensure your products quality
- To avoid curative maintenance which is expensive and causes delays

In order to help you to achieve these goals, GEPS Services meet your needs by providing a customised offer for the preventive maintenance of your equipment and installations of all brands.

DIAGNOSIS OR VISIT FOR PREVENTIVE MAINTENANCE, WHILE YOUR EQUIPMENT AND INSTALLATION ARE WORKING

This visit or diagnosis is **jointly made** by GEPS Services **technicians and the operators**, according to a timetable agreed between them (for example every 6 months).

The aim is to define the condition of the different devices in order to anticipate the parts availability and schedule the actions of preventive maintenance.

PREVENTIVE MAINTENANCE

During a scheduled production shutdown, when the installation has been out of use, stopped and secured, GEPS Services technicians **replace the wearing parts** on each piece of equipment in your installation, and carry out the actions which were defined at the time of preventive visits.

Each piece of equipment is dismantled, and our technicians carry out additional checks which **inform you about the condition of the parts**, other than the wearing ones, and allow to evaluate the **parts which will have to be replaced** later.

The **wear rate** of replaced parts is **analysed**, in order to **optimise** their replacement frequency and adjust it according to their actual working conditions.

A **quotation** including the parts replaced and taken from stock is sent to you at the end of maintenance operation to allow restocking.
